Office Action Summary

Application No.

10/616,362

Applicant(s)

HOSKING ET AL

Examiner

Christina Y. Leung

Art Unit

2633

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 29 June 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-11 and 13-23 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☒ Claim(s) 23 is/are allowed.
- 6) ☒ Claim(s) 1-11 and 13-22 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____

DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims 1, 2, 4-6, 8, 9, 13-15, and 17-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chan et al. in view of Chan et al. (US 5,801,866 A) in view of King et al. (US 5,812,572 A).

Regarding claim 1, Chan et al. discloses an optoelectronic transceiver (Figure 4), comprising:

a first controller integrated circuit (transmit controller 116) and a second controller IC (receiver controller 128), each comprising logic.:

Chan et al. further disclose that each controller integrated circuit is connected to a corresponding memory element (memory 122 and memory 144), and further disclose that the memories are configured to store digital diagnostic data, where at least some of the digital diagnostic data is common to both the first controller IC and the second controller IC (column 5, lines 20-45). Chan et al. disclose that the first and second controllers may share information; Examiner notes that the claim does not specifically disclose specific details regarding the “diagnostic data.”

Chan et al. further disclose, for each controller IC, an interface electrically coupled to the memory and configured for communicating the diagnostic data to a host external to the

Art Unit: 2633

optoelectronic transceiver (the multiple RS232 interfaces shown in Figure 4, for example); and at least one input port electrically coupled to the memory and configured to receive the diagnostic data from other components within the optoelectronic transceiver (i.e., the input ports coupled to the photodiode 112 or laser 90, for example)..

Chan et al. do not specifically disclose that each integrated circuit itself includes integrated memory, but it is well known in the art that a controller, particularly a controller comprising a microprocessor such as disclosed by Chan et al., may include memory as part of its integrated circuit. King et al. particularly teach an optoelectronic device related to the one disclosed by Chan et al. including a controller 50 with logic and memory (Figure 1).

Regarding claim 6 in particular, King et al. further teach storing data in different memory mapped locations in memory within a controller (column 13, lines 58-67; column 14, lines 1-9).

Regarding claims 1 and 6, it would have been obvious to a person of ordinary skill in the art to use controllers with integrated memory as suggested by King et al. in the system disclosed by Chan et al. in order to provide a more compact system and allow the logic in the controllers to access internal memory quickly (instead of over external connections).

Regarding claim 2, Chan et al. disclose that the interface is a serial interface (i.e., RS232 serial interfaces).

Regarding claims 4 and 5, Chan et al. disclose other components including an transmitter/laser subassembly 90, a laser driver IC 94, and a receiver subassembly 112, for example.

Regarding claim 8, Chan et al. disclose a system as discussed above with regard to claim 1, and they further disclose that one of the controller ICs is electrically coupled to a

Art Unit: 2633

thermoelectric cooler driver IC (temperature controller 54 in Figure 7, for example) to supply a TEC control signal (column 6, lines 63-66).

Further regarding claim 8, Chan et al. disclose that a controller IC is generally configured to control current supplied to a transmitter (Figure 7 shows controller 68 coupled to current control 64, for example), but Chan et al. do not disclose specifically controlling alternating current supplied to the transmitter. However, King et al. teach that controller IC 50 (Figure 1) is configured to control AC modulation current supplied to a transmitter (column 7, lines 3-25).

Regarding claim 9 in particular, King et al. further suggest providing the AC modulation current control signal to the laser via a digital to analog converter 24 (Figure 1).

Regarding claims 8 and 9, it would have been obvious to a person of ordinary skill in the art to specifically enable one of the controllers in the system described by Chan et al. in view of King et al. to control the modulation current supplied to the transmitter via a digital to analog converter, as taught by King et al., in order to provide specific control over the modulation current input to the laser.

Regarding claim 13, Chan et al. disclose that a controller IC is electrically coupled to a thermistor (i.e., a temperature sensor) disposed within the optoelectronic transceiver (column 7, lines 6-9).

Regarding claim 14, Chan et al. disclose a power source (such as power supply 8 shown in Figure 5). It would also be well understood in the art that the two controllers disclosed by Chan et al. inherently require connection to some source of power in order to function properly.

Regarding claims 15 and 17, Chan et al. in view of King et al. describe a system as discussed above with regard to claim 1. Chan et al. further disclose that a controller IC is

Art Unit: 2633

generally configured to control current supplied to a transmitter (Figure 7 shows controller 68 coupled to current control 64, for example), but Chan et al. do not disclose specifically controlling direct current or alternating current supplied to the transmitter. However, King et al. teach that controller IC 50 (Figure 1) is configured to control DC bias current to a transmitter (column 6, lines 62-66; column 7, lines 26-31) and AC modulation current supplied to a transmitter (column 7, lines 3-25).

Regarding claims 15 and 17, it would have been obvious to a person of ordinary skill in the art to specifically enable one of the controllers in the system described by Chan et al. in view of King et al. to control the bias current or the modulation current supplied to the transmitter, as taught by King et al., in order to provide specific control over the two types of current input to the laser.

Examiner notes that although claims 15 and 17 recite “first controller IC” and “second controller IC” respectively, the claims each separately depend on claim 1, and not on each other. Therefore, the terms “first controller IC” and “second controller IC” in both claims 15 and 17 simply refer to “one of” the two controllers recited in claim 1.

Regarding claim 18, Chan et al. disclose one of the controller ICs is configured control a thermoelectric cooler in a transmitter optical subassembly (column 6, lines 63-66).

Regarding claim 19, Chan et al. in view of King et al. describe a system as discussed above with regard to claim 1 and Chan et al. further disclose that second controller comprises a microprocessor with logic that can execute stored programs. Although they do not specifically disclose first controller may include state machines, it is well understood in the art that the logic of a processor commonly includes state machines (i.e., some gates/logic for producing certain

Art Unit: 2633

outputs when certain corresponding conditions are input). The claim does not recite further details regarding the state machines. It would have been obvious to a person of ordinary skill in the art to specifically include state machines in the first controller in the system described by Chan et al. in view of King et al. in order to allow the controller to process input signals and generate useful outputs based on the inputs.

2. Claim 3 is rejected under 35 U.S.C. 103(a) as being unpatentable over Chan et al. in view of King et al. as applied to claims 1 and 2 above, and further in view of Jau et al. (US 6,205,505 B1).

Regarding claim 3, Chan et al. in view of King et al. describe a system as discussed above with regard to claims 1 and 2 including a serial interface, but they do not specifically disclose an I2C serial interface, a 2Wire serial interface, and an MDIO serial interface. However, different serial interfaces are well known in the art, as Jau et al. particularly suggest (column 3, lines 37-42), that are interchangeable with the RS232 serial interface already disclosed by Chan et al. It would have been obvious to a person of ordinary skill in the art to use a I2C serial interface, as suggested by Jau et al. for example, instead of the serial interface in the system described by Chan et al. in view of King et al. as an engineering design choice of a serial interface depending on the connected host and other equipment in the system. The claimed differences exist not as a result of an attempt by Applicants to solve an unknown problem but merely amount to the selection of expedients known as design choices to one of ordinary skill in the art.

Art Unit: 2633

3. Claims 7, 11, and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chan et al. in view of King et al. as applied to claim 1 above, and further in view of Traa (US 6,222,660 B1).

Regarding claim 7, Chan et al. in view of King et al. describe a system as discussed above with regard to claim 1, but they do not specifically disclose that either controller IC is configured to control the power of the avalanche photodiode 112. However, Traa teaches a system related to the one disclosed by Chan et al. including an optoelectronic receiver (Figure 1). Traa further teaches an avalanche photodiode (APD 10) coupled to an APD power supply (voltage supply 12) coupled to a controller IC 18 configured to supply an APD power supply control signal to the APD power supply causing the APD power supply to supply an APD voltage to the APD (column 2, lines 37-54). It would have been obvious to a person of ordinary skill in the art to include an avalanche photodiode power supply as taught by Traa in the system described by Chan et al. in view of King et al. in order to optimize the power of the optoelectronic receiver and thereby prevent excessive noise output (as Traa teaches; column 1, lines 5-39).

Further regarding claim 7, Chan et al. further disclose that a controller IC is generally configured to control current supplied to a transmitter (Figure 7 shows controller 68 coupled to current control 64, for example), but Chan et al. do not disclose specifically controlling direct current supplied to the transmitter. However, King et al. teach that controller IC 50 (Figure 1) is configured to control DC bias current to a transmitter (column 6, lines 62-66; column 7, lines 26-31).

Art Unit: 2633

Regarding claim 7, it would have been obvious to a person of ordinary skill in the art to specifically enable one of the controllers in the system described by Chan et al. in view of King et al. and Traa to control the bias current supplied to the transmitter, as taught by King et al., in order to provide specific control over the bias current input to the laser.

Regarding claim 11, Chan et al. in view of King et al. describe a system as discussed above with regard to claim 1. Chan et al. further disclose that a controller IC is coupled to a Thermoelectric Cooler (TEC) driver IC to receive a TEC temperature signal (column 6, lines 62-67; column 7, lines 1-10), but they do not specifically further disclose that either controller IC is configured to control the power of the avalanche photodiode 112. However, Traa teaches a system related to the one disclosed by Chan et al. including an optoelectronic receiver (Figure 1). Traa further teaches an avalanche photodiode (APD 10) coupled to an APD power supply (voltage supply 12) coupled to a controller IC 18 configured to supply an APD power supply control signal to the APD power supply causing the APD power supply to supply an APD voltage to the APD (column 2, lines 37-54). It would have been obvious to a person of ordinary skill in the art to include an avalanche photodiode power supply as taught by Traa in the system described by Chan et al. in view of King et al. in order to optimize the power of the optoelectronic receiver and thereby prevent excessive noise output (as Traa teaches; column 1, lines 5-39).

Further regarding claim 11, Chan et al. in view of King et al. describe a system as discussed above with regard to claim 1 but Chan et al. do not specifically disclose that a controller IC is coupled to receive a direct current (DC) bias monitor signal and a laser diode monitor signal. However, King et al. further teach that a controller IC 50 (Figure 1) is coupled to

Art Unit: 2633

a laser driver IC to receive a direct current (DC) bias monitor signal (from “average bias monitor” as shown in Figure 1; column 12, lines 33-37) and a laser diode monitor signal (from monitor photodiode 40; column 8, lines 10-24). It would have been obvious to a person of ordinary skill in the art to include a direct current bias monitor signal and a laser diode monitor signal as taught by King et al. in the system described by Chan et al. in view of King et al. in order to provide additional monitoring and feedback for optimizing the power output of the laser transmitter. Chan et al. already disclose that a controller IC (such as logic controller 28 in Figure 7) generally receives a laser monitor signal (from monitor photodiode 62).

Regarding claim 16, Chan et al. in view of King et al. describe a system as discussed above with regard to claim 1, but they do not specifically disclose that either controller IC is configured to control the power of the avalanche photodiode 112. However, Traa teaches a system related to the one disclosed by Chan et al. including an optoelectronic receiver (Figure 1). Traa further teaches an avalanche photodiode (APD 10) coupled to an APD power supply (voltage supply 12) coupled to a controller IC 18 configured to supply an APD power supply control signal to the APD power supply causing the APD power supply to supply an APD voltage to the APD (column 2, lines 37-54). It would have been obvious to a person of ordinary skill in the art to include an avalanche photodiode and APD power supply as taught by Traa in the system described by Chan et al. in view of King et al. in order to optimize the power of the optoelectronic receiver and thereby prevent excessive noise output (as Traa teaches; column 1, lines 5-39).

Art Unit: 2633

4. Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Chan et al. in view of King et al. as applied to claim 1 above, and further in view of Traa and Giebel et al. (US 5,926,303 A)

Regarding claim 10, Chan et al. in view of King et al. describe a system as discussed above with regard to claim 1, but they do not specifically disclose that either controller IC is configured to control the power of the avalanche photodiode 112. However, Traa teaches a system related to the one disclosed by Chan et al. including an optoelectronic receiver (Figure 1). Traa further teaches an avalanche photodiode (APD 10) coupled to an APD power supply (voltage supply 12) coupled to a controller IC 18 configured to supply an APD power supply control signal to the APD power supply causing the APD power supply to supply an APD voltage to the APD (column 2, lines 37-54). It would have been obvious to a person of ordinary skill in the art to include an avalanche photodiode power supply as taught by Traa in the system described by Chan et al. in view of King et al. in order to optimize the power of the optoelectronic receiver and thereby prevent excessive noise output (as Traa teaches; column 1, lines 5-39).

Further regarding claim 10, Chan et al. in view of King et al. describe a system as discussed above with regard to claim 1 but Chan et al. do not specifically disclose that a controller IC is coupled to receive a direct current (DC) bias monitor signal and a laser diode monitor signal. However, King et al. further teach that a controller IC 50 (Figure 1) is coupled to a laser driver IC to receive a direct current (DC) bias monitor signal (from “average bias monitor” as shown in Figure 1; column 12, lines 33-37) and a laser diode monitor signal (from monitor photodiode 40; column 8, lines 10-24). It would have been obvious to a person of

Art Unit: 2633

ordinary skill in the art to include a direct current bias monitor signal and a laser diode monitor signal as taught by King et al. in the system described by Chan et al. in view of King et al. in order to provide additional monitoring and feedback for optimizing the power output of the laser transmitter. Chan et al. already disclose that a controller IC (such as logic controller 28 in Figure 7) generally receives a laser monitor signal (from monitor photodiode 62).

Further regarding claim 10, Chan et al. in view of King et al. (and Traa) do not specifically suggest that the controller is connected to a post amplifier IC to receive a loss of received power signal.

However, Giebel et al. teach another optoelectronic transceiver related to the one already suggested by Chan et al. in view of King et al. and Traa, including an optical receiver (Figures 3 and 4). Giebel et al. further teach a receiving a loss of received power signal from a post amplifier IC (preamp 144 in Figure 4, which may be considered a "post amplifier" in the sense that it amplifies an electrical signal after opto-electrical conversion; column 10, lines 40-61). It would have been obvious to a person of ordinary skill in the art to include a post amplifier as taught by Giebel et al. in the system described by Chan et al. in view of King et al. and Traa in order to detect when the received signal has been lost so that the system can respond to the potential fault.

5. Claim 20 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kollanyi et al. (US 4,809,286 A) in view of King et al.

Regarding claim 20, Kollanyi et al. disclose an optoelectronic transceiver (Figures 1 and 2) comprising:

an optoelectronic transmitter (laser 160);

Art Unit: 2633

an optoelectronic receiver (optical detector 110);
a laser driver 170 electrically coupled to the optoelectronic transmitter;
a post amplifier 120 electrically coupled to the optoelectronic receiver;
a first controller integrated circuit (laser DC bias control 150) electrically coupled to the laser driver, where the first controller IC is configured to supply a direct current (DC) bias current control signal to the laser driver causing the laser driver to supply DC bias current to the optoelectronic transmitter (column 3, lines 45-48);

a second controller IC (data driver 180) electrically coupled to the laser driver to supply an alternating current (AC) current control signal to the laser driver causing the laser driver to supply AC current to the optoelectronic transmitter (column 4, lines 17-24).

Kollanyi et al. disclose circuits for providing control signals related to DC bias current and AC modulation current, respectively, to the laser driver, but they do not specifically disclose that the DC bias current has a predetermined level determined by the DC bias current control signal or that the AC current has a predetermined level determined by the AC current control signal

However, King et al. teach a system related to the one disclosed by Kollanyi et al. including an optical transmitter with a laser driver circuit (Figure 1). King et al. further teach generally providing a DC bias current control signal and an AC modulation current control signal to control the currents of laser to predetermined levels (column 6, lines 62-66; column 7, lines 3-31). It would have been obvious to a person of ordinary skill in the art to further provide current control signals that set the laser currents to predetermined levels as suggested by King et al. in

Art Unit: 2633

the circuitry disclosed by Kollanyi et al. in order to more effectively control and maintain the laser output within a desired range of values.

6. Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kollanyi et al. in view of King et al. as applied to claim 20 above, and further in view of Traa.

Regarding claim 21, Kollanyi et al. in view of King et al. describe a system as discussed above with regard to claim 20 and Kollanyi et al. further disclose that the optoelectronic receiver includes a photodetector 110, but they do not specifically disclose an avalanche photodiode coupled to a APD power supply. However, Traa teaches a system related to the one disclosed by Kollanyi et al. including an optoelectronic receiver (Figure 1). Traa further teaches an avalanche photodiode (APD 10) coupled to an APD power supply (voltage supply 12) coupled to a controller IC 18 configured to supply an APD power supply control signal to the APD power supply causing the APD power supply to supply an APD voltage to the APD (column 2, lines 37-54). It would have been obvious to a person of ordinary skill in the art to include an avalanche photodiode and APD power supply as taught by Traa in the system described by Kollanyi et al. in view of King et al. in order to optimize the power of the optoelectric receiver and thereby prevent excessive noise output (as Traa teaches; column 1, lines 5-39).

7. Claim 22 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kollanyi et al. in view of King et al. as applied to claim 20 above, and further in view of Thorton (US 2004/0202210 A1).

Regarding claim 22, Kollanyi et al. in view of King et al. describe a system as discussed above with regard to claim 20 and Kollanyi et al. further disclose that the optoelectronic

Art Unit: 2633

transmitter includes a temperature controller 140 (Figure 2), but they do not specifically disclose a thermoelectric cooler (TEC) and TEC driver. However, Thorton teaches a system related to the one described by Kollanyi et al. in view of King et al. including a transmitter controller (Figure 3). Thorton further teaches a thermoelectric cooler 326 (page 4, paragraph [0049]) coupled to a TEC driver (temperature control 342) coupled to a controller IC (i.e., “control unit” as shown in Figure 3) configured to supply a TEC control signal to the TEC driver causing the TEC driver to control the TEC. It would have been obvious to a person of ordinary skill in the art to include a temperature controller and driver as taught by Thorton in the system described by Kollanyi et al. in view of King et al. in order to stabilize the temperature of the laser and thereby stabilize the output of the transmitter.

Allowable Subject Matter

8. Claim 23 is allowed.

9. The following is a statement of reasons for the indication of allowable subject matter:

As noted in the previous Office Action with regard to claim 12 (now canceled and rewritten in independent form as claim 23), the prior art, including Chan et al. and King et al., does not specifically disclose or fairly suggest a system including all the elements, steps, and limitations in the specific combination recited in claim 23, particularly wherein a first controller comprises at least one input port electrically coupled to an avalanche photodiode power supply to receive a photodiode monitor signal; a post amplifier IC to receive a loss of received power signal; and a laser driver IC to receive a direct current (DC) bias monitor signal and a laser diode monitor signal; and a different, second controller receives the aforementioned photodiode monitor signal and the aforementioned DC bias monitor signal via an analog to digital converter.

Response to Arguments

10. Applicants' arguments filed 29 June 2005 with respect to claims 20-22 have been considered but are moot in view of the new ground(s) of rejection.

11. Applicants' arguments filed 29 June 2005 with respect to claims 1-11 and 13-19 have been fully considered but they are not persuasive.

Regarding claims 1-11 and 13-19, Examiner respectfully disagrees with Applicants' assertion on pages 9-10 of their response that Chan et al. in view of various other references do not disclose and/or teach all of the claim limitations. In response to Applicants' argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which Applicants rely (i.e. that the first controller IC memory element and the second controller IC memory element each contain copies of a same digital data, wherein the data is specifically related to transceiver performance diagnostics) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

Independent claim 1 only recites that at least some of the data is "common" to the first IC and the second IC. As discussed in the rejections above, Chan et al. disclose first and second controllers, each with associated memory elements, wherein the memory elements store data that is "common" to both ICs, in the sense that the data stored in the memory elements include some data that concerns, or is processed by, both ICs.

Examiner also respectfully disagrees with Applicants' assertion on page 9 of their response that Chan et al. refer "to storing data from the transmit controller only and not the receiver controller." On the contrary, Chan et al. disclose that the receiver microcontroller 128 is

Art Unit: 2633

able to receive data (such as from another transceiver) and store it in memory (column 5, lines 34-44).

Also, Examiner respectfully notes that Applicants assert that Chan et al. do not mention “that some of the data common to both controllers is stored in a shared memory” on page 9, but based on Applicants’ specification, Applicants’ invention is also not literally directed to “a shared memory,” i.e., a single memory element shared between the first and second controller ICs. In particular, Applicants’ Figures 3 and 5, for example, indicate that each controller has its own memory element.

Again, Examiner also respectfully notes that the claim does not specifically disclose specific details regarding the “diagnostic data.” For example, the claim does not specifically recite that the “diagnostic data” is directly related to diagnosing characteristics of the transceiver elements themselves. Chan et al. disclose diagnostic data in the sense that they disclose data for providing information about GPS data, etc. that is useful for diagnosing/determining location and other information in the context of their system.

Conclusion

12. Applicants’ amendment (specifically, the amendment of claim 20) necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicants are reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after

Art Unit: 2633

the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

13. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Christina Y. Leung whose telephone number is 571-272-3023.

The examiner can normally be reached on Monday to Friday, 6:30 to 3:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jason Chan can be reached on 571-272-3022. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 571-272-2600.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
